Ruby on Rails Short Course: Advanced Model Relations

William Sobel

UC Berkeley RAD Lab

Outline of the day

1. Web apps, MVC, SQL, Hello World
2. Just enough Ruby
3. Basic Rails

Lunch break

4. Advanced model relations
5. AJAX & intro to testing
6. Configure and Deploy

Informal discussion: RoR and pedagogy

Section 4

- Review
  - Conventions
- Associations
  - One-to-one, one-to-many, many-to-many
- Transactions
- Advanced
  - Counters, Locking, Single-Table-Inheritance, …

The Model

- Place all database access in the model
- Place all validations in the model
  - Do not validate values in the controller!
- Place all business logic in the model
  - All computations
  - All object relations
- Keep your view and controller clean

Guidelines

Be Conventional

- Name your tables the plural of the class
- Name your foreign key columns: <class>_id
- Join tables are named with the first table name _ second table name (alphabetical order) ex. accounts_users

- Use Migrations
  - Cross database SQL generation
  - Automatic Schema Management

Associations

- Powerful Meta-Programming Tools to Express Relationships Between Classes
- Supports
  - One-to-one (has and belongs to)
  - One-to-many
  - Many-to-many (using join table) habtm
  - Many-to-many (using join-model) hmt

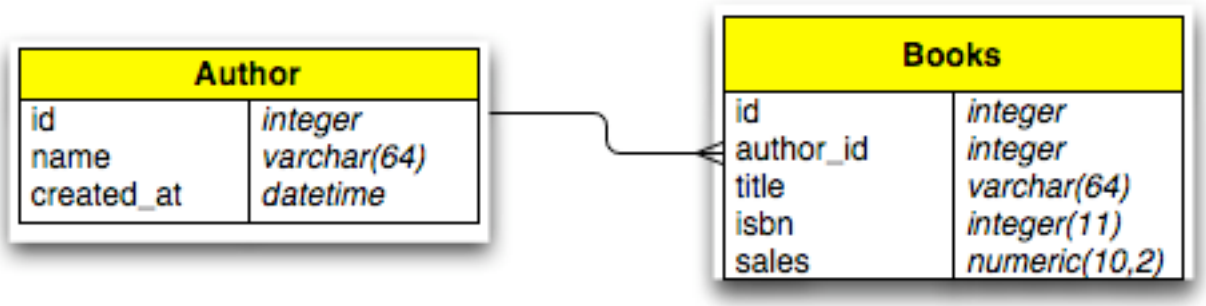
Associations

A simple model, let's start with the DB

```
class CreateAuthors < ActiveRecord::Migration
  def self.up
    create_table :authors do |t|
      t.column :name, :string
      t.column :created_at, :datetime
    end

    create_table :books do |t|
      t.column :author_id, :integer
      t.column :title, :string, :limit => 64
      t.column :isbn, :decimal, :percision => 11
      t.column :sales, :decimal, :percision => 10, :scale => 2, :default => 0
    end
  end

  def self.down
    drop_table :accounts
    drop_table :books
  end
end
```

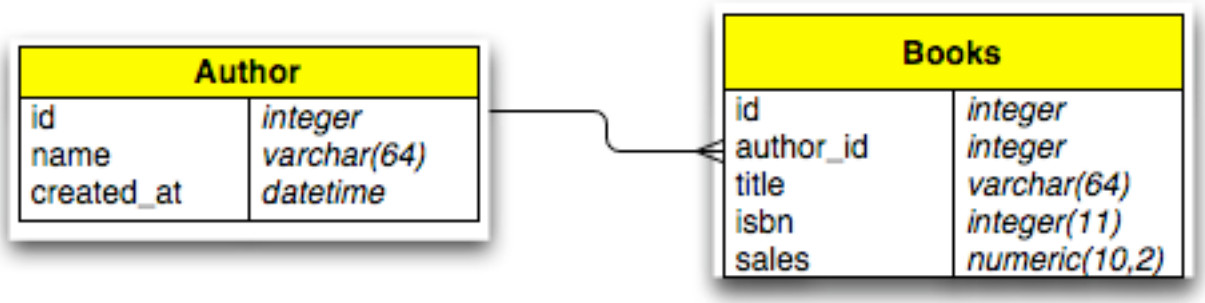


Associations

Now for the Active Record classes

```
class Author < ActiveRecord::Base
  has_many :books, :foreign_key => 'author_id', :class_name => 'Book'
end

class Book < ActiveRecord::Base
  belongs_to :author, :foreign_key => 'author_id', :class_name => 'Author'
end
```



Convention

The Power of Convention

```
class Author < ActiveRecord::Base
  has_many :books
end

class Book < ActiveRecord::Base
  belongs_to :author
end
```

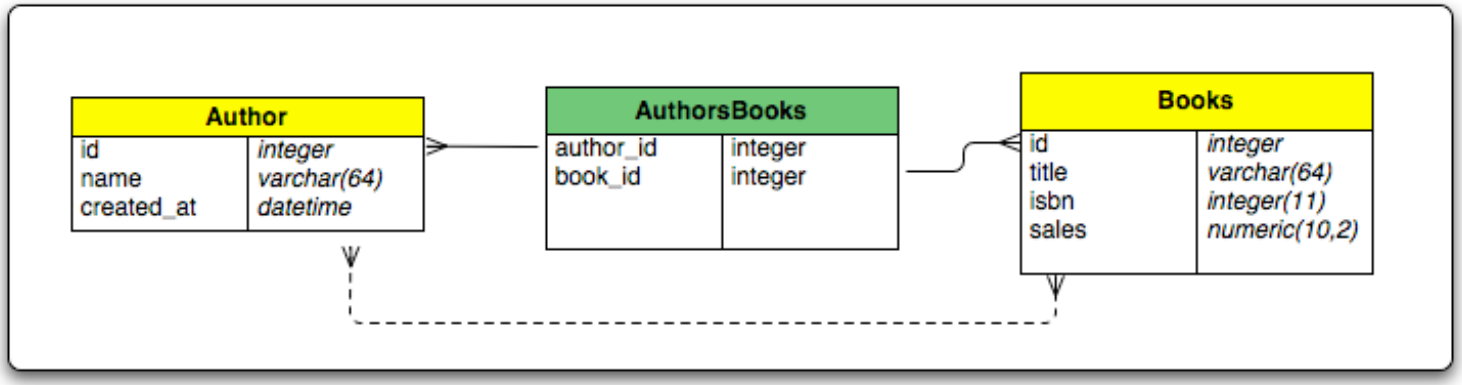
```
>> a = Author.create(:name => "Dave Thomas")
⇒  #<Author:0x34599f0 @attributes={"name"=>"Dave Thomas", "id"=>2,...>>>
>> a.books.create(:title => "Programming Ruby", :isbn => "11111111")
=> #<Book:0x345047c @attributes={"isbn"=> "11111111", "sales"=>0,
   "title"=>"Programming Ruby", …>
```

Has & Belongs to Many

Wait! That's Wrong! Books have more than one author

```
class Author < ActiveRecord::Base
  has_and_belongs_to_many :books
end

class Book < ActiveRecord::Base
  has_and_belongs_to_many :authors
end
```



Has & Belongs to Many

The Migration

```
class CreateHabtm < ActiveRecord::Migration
  def self.up
    create_table :authors_books, :id => false do |t|
      t.column :author_id, :integer
      t.column :book_id, :integer
    end

    # We no longer need this column
    remove_column :books, :author_id
  end

  def self.down
    drop_table :authors_books, :id => false
    add_column :books, :author_id, :integer
  end
end
```

Using Relations

Not as hard as you think…

```
dt = Author.create(:name => 'Dave Thomas')
ah = Author.create(:name => 'Andy Hunt')
b = Book.create(:title => 'Programming Ruby')

dt.books << b
ah.books << b

dt.books.map &:title
["Programming Ruby"]
ah.books.map &:title
["Programming Ruby"]

# Generates
SELECT * FROM books INNER JOIN authors_books ON books.id =
   authors_books.book_id WHERE (authors_books.author_id = 5 )
```

Including Relations

Optimize…

```
# Selects all the authors and pre-populates the books
# relation.
authors = Author.find(:all, :include => [:books])

# The SQL once again:
SELECT authors.`id` AS t0_r0, authors.`name` AS t0_r1,
   authors.`created_at` AS t0_r2, books.`id` AS t1_r0,
   books.`title` AS t1_r1, books.`isbn` AS t1_r2, books.`sales`
   AS t1_r3 FROM authors LEFT OUTER JOIN authors_books ON
   authors_books.author_id = authors.id LEFT OUTER JOIN books ON
   books.id = authors_books.book_id
```

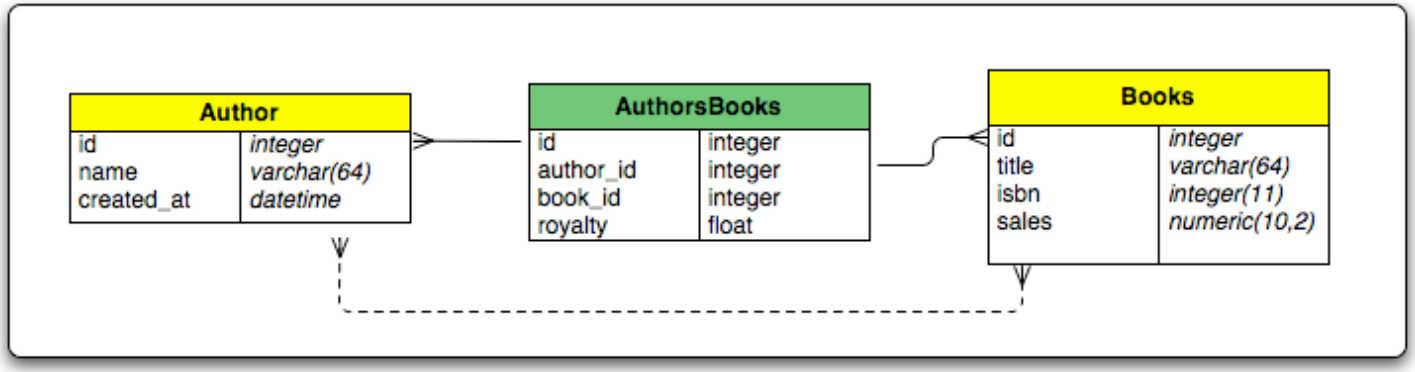
Join Model

Beyond habtm

```
class Author < ActiveRecord::Base
  has_many :authors_books
  has_many :books, :through => :authors_books
end

class Book < ActiveRecord::Base
  has_many :authors_books
  has_many :authors, :through => :authors_books
end

class AuthorsBook < ActiveRecord::Base
  belongs_to :author
  belongs_to :book
end
```



Join Model

The Migration

```
class CreateJoinModel < ActiveRecord::Migration
  def self.up
    create_table :authors_books2, :force => true do |t|
        t.column :author_id, :integer
        t.column :book_id, :integer
        t.column :royalty, :float
    end

    # Initialize the royalty column to 0.0
    ActiveRecord::Migration::execute("INSERT INTO authors_books2 (author_id, book_id,
    royalty) SELECT author_id, book_id, 0.0 FROM authors_books")

    drop_table :authors_books
    rename_table :authors_books2, :authors_books
  end

  def self.down
    …
  end
end
```

Join Model

Add some royalties to the join model

```
b = Book.find_by_title('Programming Ruby')
for ab in b.authors_books.find(:all, :include => [:author])
  ab.royalty = ab.author.name == 'Dave Thomas' ? 7 : 3
  ab.save
end

class Book < ActiveRecord::Base
  has_many :authors_books, :order => 'authors_books.royalty DESC'
  has_many :authors, :through => :authors_books,
                     :order => 'authors_books.royalty DESC'
end

b = Book.find_by_title('Programming Ruby')
b.authors.map &:name
⇒ ['Dave Thomas', 'Andy Hunt']
b.authors_books.map &:royalty
=> [7.0, 3.0]
```

Inheritance

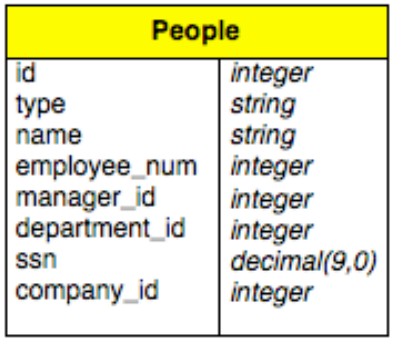
Rails supports Single-Table-Inheritance

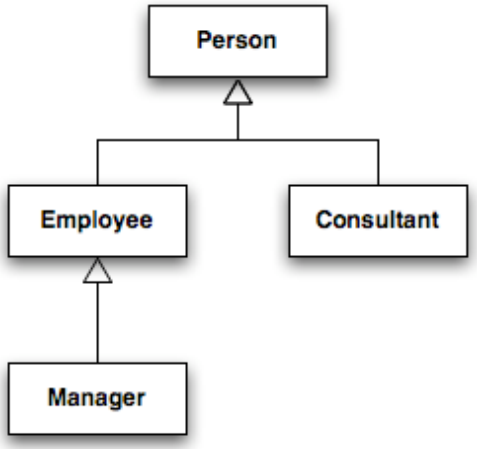
```
class Person < ActiveRecord::Base
end

class Employee < Person
  belongs_to :manager
  belongs_to :department
end

class Manager < Employee
  has_many :employees
end

class Consultant < Person
  belongs_to :company
end
```





Inheritance

Rails supports Single-Table-Inheritance

```
bob = Employee.create(:name => "Bob")
mary = Manager.create(:name => "Mary")
tim = Consultant.create(:name => "Tim")

bob.manager = mary
bob.save

mary.employees.map &:name
⇒   ['Bob']

jane = Manager.create(:name => 'Jane')
Manager.find(:all).map &:name
⇒   ['Mary', 'Jane']

jane.employees.map &:name
⇒   []

bob.manager = jane
jane.employees.map &:name
⇒   ['Bob']

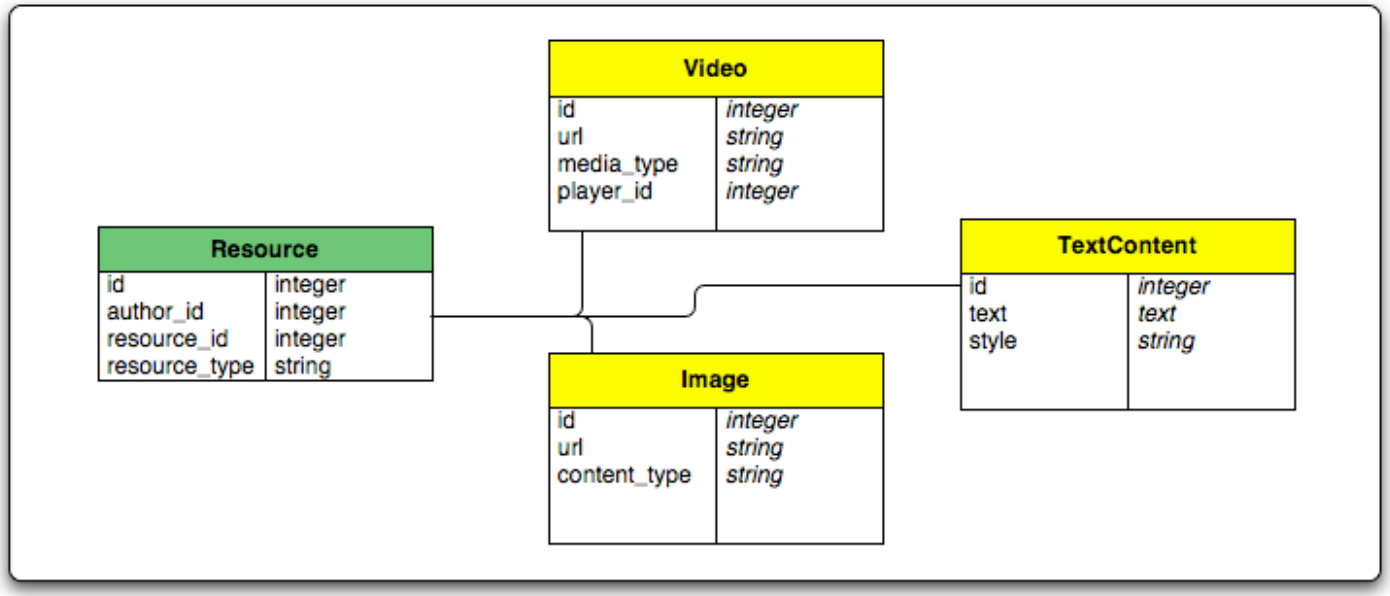
Employee.find(:all).map &:name
⇒   ['Bob', 'Mary', 'Jane']

Person.find(:all).map &:name
['Bob', 'Mary', 'Tim', 'Jane']
```

Polymorphic Associations

Associate to any object

```
class Resource < ActiveRecord::Base
  belongs_to :resource, :polymorphic => true
end
```



Calculations

- Simple syntax for computed results
  - maximum
  - minimum
  - average
  - sum
  - count

Calculations

Computed results

```
# Get the average price of all the books
price = Book.average(:price)

# How many books?
count = Book.count
```

:conditions - SQL where statement

:having - Having clause

Calculations

Groups

```
prices = Book.maximum(:price,
          :group => 'Category')
=> [['Humor', 7.95], ['Fantasy', 4.3], …]
```

Counting

```
num = Book.count ['price > ?', price]

num = Book.count ['price > ?', price],
  'left join authors_books on book_id =
  books.id'

num = Book.count_by_sql('…')
```

Transactions

```
Author.transaction(author1, author2) do
  # Do some work
  author1.books << book
  author2.books << book
end # Auto Commits

# If this transaction fails, author1 and
  author2 are restored to their previous
  state.
```

Composition

- Aggregations

```
class Money
  attr_accessor :amount, :currency

  def initialize(amount, currency)
    @amount = amount
    @currency = currency
  end

  def convert(currency)
    # Get rate
    @amount * rate
  end
end

class Book < ActiveRecord::Base
  composed_of :price, :class_name => Money,
        :mapping => [[:amount, :amount], [:currency, :currency]]
end
```

Composition

- Using Composed Object

```
price = Money.new(29.95, 'USD')
book = Book.create(:title => 'Programming Ruby',
                   :price => price)

book = Book.find_by_title('Programming Ruby')
price = book.price

price.amount
⇒ 29.95

price.convert('EUR')
⇒ 22.02
```

Counter Caching

- Common pattern in web application
  - How many books does this author have?

```
add_column :authors, :authors_books_count,
                :integer, :default => 0

class AuthorsBook < ActiveRecord::Base
  belongs_to :author, :counter_cache => true
  …
end

dt = Author.find_by_name('Dave Thomas')
b = Book.create(:title => 'Agile Rails 2')
dt.reload
dt.books << b
dt.authors_books_count
⇒ 1
b2 = Book.find_by_title('Programming Ruby'); dt.books << b2
dt.reload
dt.authors_books_count
⇒ 2
```

Acting As

- Become a Tree…

```
create_table :groups do |t|
  t.column :name, :string
  t.column :parent_id, :integer
end

class Group < ActiveRecord::Base
  acts_as_tree :order => :name
  # Creates parent and chidren relationships…
end

root = Group.create(:name => 'root')
root.children.create(:name => 'Child 1')
root.children.create(:name => 'Child 2')
```

Acting As

- Become a List…

```
create_table :thumbnails do |t|
  t.column :filename, :string
  t.column :picture_id, :integer
  t.column :position, :integer
end

class Picture < …; has_many :thumbnails, :order => position; end

class Thumbnail < ActiveRecord::Base
  belongs_to :picture
  acts_as_list :scope => :picture
end

picture = Picture.new(:name => 'picture 1')
picture.thumbnails.create(:filename => 'f.gif')
picture.thumbnails.create(:filename => 'f.png')
picture.thumbnails.create(:filename => 'f.jpg')

picture.thumbnails[0].move_lower
picture.thumbnails[0].move_to_top
```

What's Next

- Not Every Model Persists
  - If it can CRUD, it can model…
  - Tie together RESTful apps. My Model ties to your REST interface.
  - No more WebService as separate service
- Alternatives to Relational
  - Ontology based data-stores
  - S3
  - SOLR, Ferret, …
  - ?

Questions
